

“Issue Regards” extension allows returning of information regarding which item returned an error. for example, an application may want to know why patients from a list of patients were not returned in a search result, the reason for the absence of each one and their MRN. The base OperationOutcome resource may return the coded reason, but there is no discrete standard element that may hold the MRN. There are only ambiguous ways to return this information, such as in the text description of the error.

The extension is being used for “Tofes 17” (CoverageEligibilityRequest and Response) use case implementation. The solution design document is available here:
